

“Open call for Minigrad Developers: we are looking for co-development partners to apply our solar water purification technology for innovative business models.”

Are you a Minigrad Developer looking for a sustainable business model?

If so, probably you are looking into productive use of energy as *an anchor load* to reach your financial sustainability. This is where we can help each other. Together, we can co-develop and enhance the projects' profitability, through our Innovative Water Purification Technology.

Genius Watter is an Italian based company specialized in Reverse Osmosis Water Purification, powered only by the sun, through its own technology and patents.

We have the capabilities to provide clean and drinking water to sub-Saharan Africa and South East Asia's population.

Our *containerized* water systems stand out for reliability and robustness, powered by solar energy, without the need of battery storage. Furthermore, Genius Watter's system perfectly fits anywhere the lack of energy is bound with the need of drinking water.

We believe that when the lack of drinking water comes together with the lack of energy, we can help Minigrad developers to increase the sustainability and profitability of their business model (and the water produced with energy in excess may be stored and serve as a “virtual battery”).

In addition to providing energy, water as a service can add another revenue stream to your business model.

We are looking for codevelopers to explore together these possibilities and contribute to answering the Water Energy Food Nexus.

We are open to evaluate different scenarios based on win-win approach.

Together we can enhance new sustainable business models and build relevant opportunities.
